

Represent word problems with equations

Adult-led preparation before the main lesson. Use precise vocabulary and one step at a time.

Name: _____ Date: _____

1. Which prior skill will help with today's lesson? Use inverse operations and the structure of equations to find unknown values.

2. Do $4x + 12 = 40$ and $2x + 6 = 20$ have the same solution?

3. Explain the first step you would take for: A number is tripled and 14 is added to make 65. Find the number.

4. Miro says: Miro changes one side of an equation without making the same balanced change to the other side. What should Miro check?

Teacher answers and checking prompts

1. Which prior skill will help with today's lesson? Use inverse operations and the structure of equations to find unknown values.

Answer Pupil identifies a relevant fact, representation or method.

2. Do $4x + 12 = 40$ and $2x + 6 = 20$ have the same solution?

Answer Yes, both give $x = 7$.

3. Explain the first step you would take for: A number is tripled and 14 is added to make 65. Find the number.

Answer Keep both sides balanced and identify the outer operation.

4. Miro says: Miro changes one side of an equation without making the same balanced change to the other side. What should Miro check?

Answer Use an inverse operation on the whole equation and check by substitution.
